J-Vo PROPERTIES

PRODUCT REQUIREMENTS DOCUMENT

I-Property

Rental Property Operations Platform

Version 1.0 · April 2025 ·

Company	J-Vo Properties
Product	I-Property — Rental Property Operations Platform
Product Owner	Vice President, Property Operations
Version	1.0 — Revised for Investment Review
Date	April 2025
Prepared by	Product Owner, Technology Division
Status	Pending Executive Approval — Investment Cycle Q2 2025
Classification	Confidential — Restricted to Leadership and Technology Teams
Related Docs	BRD v1.3 · SRS v3.0 · UI Design Specification (Pending) · Architecture Document (Pending)

DISTRIBUTION NOTICE

This document is restricted to J-Vo authorized recipients only. Its contents may not be disclosed,
reproduced, or distributed without prior written consent of the organization.

1. Product Vision

I-Property is designed to transform J-Vo's property management operations from a fragmented, manual process into a governed, system-driven platform.

It serves as the single source of truth for all rental property activities while ensuring that every agreement, approval, payment, and document is processed accurately, tracked transparently, and accessible in real time.

The platform replaces reliance on spreadsheets, emails, and institutional memory with structured workflows, enforced approvals, and complete audit visibility that enables J-Vo to scale its operations with confidence, control, and efficiency.

2. Stakeholder Perspectives

Each perspective reflects the operational reality of a specific role and what that role needs from I-Property to do its job better.

2.1 Vice President, Property Operations

VP of Property Operations · Executive Leadership

Current Challenge: Managing a 200+ agreement portfolio across three California markets with no single system of record means I am constantly operating on incomplete information. When the CFO asks me for a portfolio summary, I have to pull data from three different sources and hope they agree. When a lease is up for renewal, I find out either because someone remembered to tell me or because the tenant called. Neither is acceptable at this scale.

What They Need: A single, real-time view of the entire portfolio status — agreements active, pending, expiring, and in progress. The ability to see where any request is in the approval chain at any given moment. Confidence that what Finance is processing reflects what was actually approved.

2.2 Director of Finance Operations

Director of Finance Operations · Finance Division

Current Challenge: Every month, my team spends roughly two days validating the rental payment list before we can process it in Oracle Financial. We cross-reference the list against the original lease agreements, check the tax calculations, and try to reconcile any discrepancies we find. We have identified 14 discrepancies per quarter on average — most are calculation errors, some are amounts that were never updated when a lease was renewed. Twice in 2024, we processed payments against agreements that had already been terminated. The financial exposure from that kind of error is significant.

What They Need: A system-generated, Finance-ready payment instruction that I can trust. Every amount calculated by the system using the actual agreement terms. Every stopped payment documented with a reason. Oracle Financial integration so my team does not re-key data that already exists in another system.

2.3 Director of Legal & Compliance

Director of Legal & Compliance · Legal Division

Current Challenge: In 2024, we had three situations where a dispute with a tenant or a vendor required us to produce the full approval history for a lease agreement. In each case, we spent between two and four days reconstructing that history from email archives, filing cabinets, and people's memories. In one case, we could not fully reconstruct it, which placed us

in a weaker negotiating position than we should have been in. California's commercial lease documentation requirements are not getting simpler — they are getting more stringent.

What They Need: A tamper-proof, permanently stored approval trail for every agreement. The ability to produce a complete audit package — agreement, all approvals with names and timestamps, all document versions — in under 30 minutes in response to any legal or regulatory request.

2.4 Regional Property Operations Manager

Regional Property Operations Manager · Field Operations (Los Angeles Region)

Current Challenge: When I submit a new lease request today, it goes into an email and I lose sight of it. I have no idea if it was approved, rejected, or sitting in someone's inbox. I find out it was rejected — often with no explanation — when Finance eventually tells me the payment was not processed. By that point, we may have already communicated terms to the tenant that we cannot honor. That erodes trust with our tenants and creates legal exposure for the company.

What They Need: Real-time visibility into every request I submit. Immediate notification when a request is approved or rejected, with the reason clearly stated. The ability to track where any request is in the approval chain without having to call anyone.

2.5 Head of Internal Audit

Head of Internal Audit · Audit & Compliance

Current Challenge: Our current audit findings consistently include the same categories of gap: approval chain documentation, lease agreement version control, and payment authorization trails. These are not findings that reflect bad intent — they reflect the absence of a system that enforces good process. Every year, we make the same recommendations. Every year, the operational team makes the same good-faith effort to improve with the tools they have. The tools are the problem.

What They Need: A system that makes compliance the default, not the exception. Complete, searchable audit logs that cover every user action. Approval history that cannot be edited or deleted. The ability to produce a clean audit trail for any agreement, for any period, in under an hour.

2.6 IT Director

IT Director · Technology Division

Current Challenge: We currently have no integrated system for property management. Every integration request — between Operations, Finance, and Legal — is ad hoc, manual, and prone to breaking when any one team changes their process. We have no audit log of system access because there is no system to log. When Finance discovers an error, we have no way to determine whether it originated in a spreadsheet formula, a data entry mistake, or a miscommunication. Our Oracle Financial instance is underutilized because the data flowing into it is unreliable.

What They Need: A well-architected platform with clear API contracts, role-based access control, and a reliable Oracle Financial integration. A system that IT can maintain and extend without heroics. Proper security posture — TLS encryption, SSO integration, data-at-rest encryption for sensitive financial fields.

3. What We Are Building

I-Property is a web-based commercial lease operations platform built for J-Vo's internal teams. It manages the full lifecycle of every lease agreement from initial request through multi-level approval, payment processing, renewal management, and eventual termination while maintaining a complete, tamper-proof audit trail of every action taken.

3.1 The Platform in Plain Language

I-Property controls operational access and process flow for our lease agreements. Every request enters through a defined intake form. Every approval travels a defined path. Every payment is calculated by the system, not by a human with a spreadsheet. Every document lives in one place, permanently, accessible to authorized users within seconds.

3.2 Core Capabilities

Capability	What It Does	Business Problem It Solves
Workflow Orchestration Engine	Routes every lease request — new, renewal, or termination — through J-Vo's defined approval hierarchy: Area Officer → Regional Manager → Director → Admin HO → Finance. Every transition is enforced. No step can be skipped. Rejections require documented reasons.	Replaces the current email approval chain, which has no enforcement, no visibility, and no audit trail.
Agreement Lifecycle Management	Tracks every active lease agreement from creation through expiry. Generates automated renewal alerts at configurable lead times (default 90 days). Provides a real-time expiry dashboard color-coded by urgency.	Eliminates the current reality of agreements expiring without action because nobody tracked the date.
Automated Payment Processing	Calculates monthly rental payments, tax deductions, and net payables for every active agreement using the terms stored in the system. Generates a Finance-ready payment batch on the last working day of each month, approved by management and transmitted directly to Oracle Financial.	Replaces the monthly manual payment list that takes Finance two days to verify and regularly contains errors.
Oracle Financial Integration	Transmits approved payment batches and expense accrual entries directly to Oracle Financial via API. Receives payment confirmation references back into I-Property. Eliminates re-keying of data between systems.	Addresses the current gap where Finance manually transfers data from Operations' Excel files into Oracle Financial, introducing errors at every transfer point.
Centralized Document Management	Provides secure file storage for all lease agreements, utility bills, approval notices, and vacated notices. Every document is linked to its specific agreement and request record. No document exists outside the system.	Eliminates the current reality where documents live in filing cabinets, personal email attachments, or shared drives with no version control.
Utility Bill Management	Manages utility bill submission, approval, and Finance notification per agreement. Prevents duplicate bill submissions for the same property, period, and utility type. Maintains a complete payment history per agreement.	Addressed quarterly reconciliation.
Compliance & Audit Infrastructure	Maintains an append-only audit log of every action taken by every user, with before and after values, timestamps, and IP addresses. Generates a tamper-proof Approval Summary PDF for every completed agreement. Three-year active retention, seven-year archive.	Transforms J-Vo's compliance posture from reactive document hunting to proactive, always-ready audit readiness.
Notification & Alerting Engine	Delivers 14 categories of automated email notification — from new request	Replaces the current reliance on individuals remembering to notify other individuals,

	acknowledgments to urgent stop-payment alerts — to the right person at the right time. Configurable SLA breach alerts when approvals stall beyond defined thresholds.	which is the root cause of most approval delays and missed renewals.

4. User Stories — Who Uses I-Property and How

The following user stories define the specific interactions each role has with I-Property. They are written at the product level — focused on the outcome each role achieves — not at the technical specification level. Technical acceptance criteria are defined in the accompanying SRS v3.0.

4.1 Operations Team Stories

Story ID	Role	Story	Outcome When Done
US-01	Area / Regional Officer	As a Regional Operations Officer, I need to submit a new lease request digitally with all required fields in one place, so that I receive an immediate reference number and never lose sight of the request again.	Officer submits in under 10 minutes; receives reference ID; tracks real-time status without calling anyone
US-02	Area / Regional Officer	As a Regional Operations Officer, I need to be notified immediately when my request is rejected — with the reason stated clearly — so that I can correct and resubmit without a phone call.	Rejection reason visible in system and delivered by email; resubmission possible same day
US-03	Regional Ops Manager (ABH)	As an Area Business Head, I need a single approval queue that shows all requests pending my action, sorted by urgency, so that I never miss an approval and never action the wrong item.	ABH actions all pending items from one screen; SLA breach flags prevent requests from stalling
US-04	Regional Ops Manager (ABH)	As an Area Business Head, I need to review and approve the monthly payment summary with the ability to stop any specific payment, so that Finance always processes a clean, management-approved instruction.	Finance receives approved, accurate payment batch; stopped payments documented with reason
US-05	Admin Head Office	As Admin Head Office, I need to review all uploaded lease documents inline within the system and mark a request complete only when I am satisfied, so that Finance and Area Admin are notified instantly and simultaneously.	Document review completed faster; simultaneous notification eliminates follow-up calls
US-06	Area Admin	As an Area Admin, I need a Print Queue that only shows fully approved agreements, with all required documents bundled into a single downloadable package, so that I always print the correct version with nothing missing.	Zero instances of wrong-version printing; complete print package every time

4.2 Finance Team Stories

Story ID	Role	Story	Outcome When Done

US-07	Finance Director / Officer	As Director of Finance Operations, I need to receive a system-generated monthly payment report that is already validated against the actual lease terms, so that my team's verification work takes hours not days.	Finance verification time drops from 2 days to under 4 hours per cycle
US-08	Finance Director / Officer	As a Finance Officer, I need the monthly payment batch to be transmitted directly to Oracle Financial in the correct format, so that my team does not re-key data that already exists in another system.	Zero manual data transfer between I-Property and Oracle Financial
US-09	Finance Director / Officer	As a Finance Officer, I need to receive an immediate, documented stop-payment alert the moment a lease termination is approved, so that I can act before the next payment cycle runs.	Stop-payment instructions arrive within 2 minutes, documented with agreement ID, amount, and reason
US-10	Finance Director / Officer	As a Finance Officer, I need utility bill approvals to come with structured notification including the exact amount, period, and agreement reference, so that I can process utility payments without back-and-forth with Admin.	Utility payments processed from notification data alone; no calls to Admin required

4.3 Compliance & Leadership Stories

Story ID	Role	Story	Outcome When Done
US-11	Head of Internal Audit	As Head of Internal Audit, I need a complete, tamper-proof approval history for every lease agreement, permanently stored and accessible in under 30 minutes, so that audit responses and dispute resolution no longer require days of document recovery.	Audit evidence produced in under 30 minutes for any agreement; zero findings related to missing approval trails
US-12	Director of Legal	As Director of Legal, I need all lease documents stored centrally with version history, linked to their specific approval records, so that I can produce a complete documentation package for any dispute or regulatory request within the hour.	Legal response time to documentation requests drops from days to under 1 hour
US-13	VP of Property Operations	As VP of Property Operations, I need a real-time portfolio dashboard that shows pending approvals, expiring agreements, and payment status across all regions, so that I can manage the portfolio proactively rather than reactively.	VP has real-time portfolio visibility; board-ready reports available on demand
US-14	IT Director	As IT Director, I need I-Property to be built on a secure, maintainable architecture with SSO integration, role-based access control, and a reliable Oracle Financial API contract, so that IT can support the platform without ongoing firefighting.	Platform maintainable by IT team; security posture meets California data protection standards

5. Feature Prioritisation

Features are prioritised using the MoSCoW framework against three criteria: direct cost avoidance impact, compliance risk reduction, and user adoption dependency. Every Must Have feature is required for Phase 1 go-live. Should Have features are targeted for Phase 1 but may be deferred to Phase 1b if schedule risk materialises.

Feature	What It Delivers	Why This Priority	MoSCoW	Release
Lease Request Workflow with Enforced Approval Chain	Digital submission, multi-level approval routing (Officer → ABH → Director → Admin HO → Finance), status tracking, rejection with mandatory remarks	Directly eliminates the #1 source of approval delays and the root cause of most payment errors and compliance gaps	Must Have	Phase 1
Agreement Lifecycle & Renewal Alerts	Real-time expiry tracking; automated weekly alerts at configurable lead time; color-coded urgency dashboard; one-click renewal initiation	Annual revenue risk from missed renewals; zero tolerance for this gap at our portfolio scale	Must Have	Phase 1
Automated Monthly Payment Summaries	System-calculated payment batch; management approval with stop-payment capability; Finance-ready export; Oracle Financial transmission	Directly addresses Finance's 2-day verification burden; eliminates the payment error rate that creates correction overhead and financial risk	Must Have	Phase 1
Oracle Financial Integration	Outbound payment batch and expense accrual API; inbound payment confirmation; eliminates manual data transfer	Without this, Finance cannot fully benefit from the payment automation; re-keying reintroduces the error risk we are trying to eliminate	Must Have	Phase 1
Utility Bill Management	Agreement-level bill entry; duplicate prevention; ABH approval; structured Finance notification	Directly addresses $28.4K confirmed 2024 duplicate payments and unknown late payment penalties	Must Have	Phase 1
Centralized Document Management & Approval Summary PDF	All documents stored per agreement; inline viewer; tamper-proof auto-generated approval PDF	Required for Legal and Audit compliance posture; must be in place before go-live for compliance narrative	Must Have	Phase 1
Role-Based Access Control & Audit Trail	7 roles; area-level data isolation; append-only audit log with full before/after values	Non-negotiable security and compliance requirement; California data protection and fiduciary duty standards require it	Must Have	Phase 1
Notification Engine (14 Events)	Automated email notifications for every workflow event; async delivery; retry; SLA breach alerts	The platform does not function as a workflow tool without notifications; every user story above depends on this	Must Have	Phase 1

Live Portfolio Dashboard	Role-filtered real-time view: pending approvals, expiry alerts, payment status	VP and management adoption depends on this; without it the platform feels like a back-office system rather than a management tool	**Should Have**	**Phase 1**
SLA Breach Alerts	Configurable per-stage timers; alerts to manager and System Admin when approval stalls	Prevents the approval delays that are currently invisible; adoption by ABH and Director depends on knowing the system will escalate for them	**Should Have**	**Phase 1**
Inline Document Viewer	PDF and image review without downloading; embedded in Request Detail screen	Important for Admin HO adoption; without it, document review workflow reverts to download-and-email	**Should Have**	**Phase 1**
Signage Management Module	Signage detail entry per property; payment history; multiple signage per landlord	Valuable for complete property cost visibility but does not block Phase 1 operational gains	**Should Have**	**Phase 2**
Cheque Cancellation Processing	Cancellation linked to OF transaction reference; documented reason; reflected in reports	Finance requirement for reconciliation completeness; not a Phase 1 blocker	**Should Have**	**Phase 2**
Capex System Integration	Integration with J-Vo's Capex system for unified property improvement cost view	High strategic value for whole-of-property cost analysis; dependent on Capex API availability	**Could Have**	**Phase 2**
Mobile-Responsive UI	Full workflow capability on tablet and mobile; field officers can submit and approve on-device	Adoption benefit for field teams; Phase 1 desktop-only is acceptable with training	**Could Have**	**Phase 2**
Tenant Self-Service Portal	Read-only portal for tenants to view their lease status and payment history	High tenant experience value but requires separate security architecture and scoping; Phase 3	**Won't Have**	**Phase 2**

6. Defining Success — Metrics & Targets

Success for I-Property is not defined by whether the software ships. It is defined by whether the operational outcomes described in this document are achieved. The following metrics will be measured at 90 days and 180 days post-Phase 1 launch. Baseline values are drawn from internal operational data and stakeholder interviews conducted in Q4 2024.

6.1 Operational Efficiency Metrics

Metric	Current Baseline	90-Day Target	180-Day Target	How Measured
Average lease request cycle time (submission to Finance notification)	~15 business days	≤ 8 business days	≤ 5 business days	Median of (NE-06 timestamp − request created_at) from I-Property notification log

Agreements expiring without renewal action per quarter	8–12 (estimated)	≤ 2	0	Agreements with end_date passed and no linked renewal request in system
Finance verification time per monthly payment cycle	~2 days	≤ 8 hours	≤ 4 hours	Finance team self-reported survey at 90 and 180 days
Duplicate utility payments identified per quarter	$28.4K in 2024	$0	$0	Duplicate prevention log in I-Property; cross-check with Oracle Financial reconciliation
Payment calculation errors identified by Finance per quarter	~14 per quarter	≤ 3 per quarter	0	Finance correction log; I-Property payment audit trail

6.2 Compliance Metrics

Metric	Current Baseline	180-Day Target	How Measured
Percentage of completed agreements with full approval chain in audit log	0% (no system)	100%	COUNT(requests with all approval_history stages) / COUNT(completed requests)
Time to produce audit evidence for any agreement on request	~3 days	≤ 30 minutes	Internal Audit spot-check at 90 days; comparison to pre-launch benchmark
Percentage of stop-payment instructions with documented reason	0% (verbal only)	100%	payment_stopped rows with stop_reason populated / total stopped rows
Annual audit findings related to lease administration	2–3 per year	0 in first full audit cycle	Internal Audit annual report
Active agreements with digital document copies in system	0%	100% new; ≥80% migrated	Documents linked to agreement records in DB

6.3 Adoption Metrics

Metric	Target	How Measured
Percentage of new lease requests submitted via I-Property (vs paper/email)	100% within 60 days of go-live	requests.created_at count after go-live; confirmed with Operations leadership
Weekly active users as percentage of provisioned users	≥ 90% by Day 60	user_session_log weekly count
System availability during business hours (08:00–18:00 PT)	≥ 99.5%	Uptime monitoring; monthly report to IT Director
User-reported Priority 1 issues in first 90 days	≤ 3	IT helpdesk tickets tagged I-Property Priority 1
Net Promoter Score from internal users at 180 days	≥ +40 (industry benchmark for enterprise tools)	Anonymous survey distributed to all 7 user role groups

7. Explicit Scope Boundaries

A product requirement document is as much defined by what it excludes as by what it includes. The following are explicitly out of scope for I-Property — not because they are unimportant, but because including them would dilute the focus, extend the timeline, and delay the delivery of the operational improvements that justify this investment.

Excluded Item	Rationale	If the Business Needs This
Payment disbursement execution	Oracle Financial is J-Vo's system of record for financial transactions. Duplicating payment execution in I-Property would create reconciliation risk and require financial system licensing that is out of scope.	Oracle Financial remains the payment system. I-Property generates and transmits the approved payment instruction. This boundary is permanent.
Tenant-facing portal	A tenant-facing portal requires a separate security architecture, external authentication, and significant UX investment. The internal operational gains do not depend on it.	Evaluate as a standalone Phase 3 product if business case confirmed. Estimated additional investment: $150K–$200K.
Property maintenance and facilities management	Different process owner, different user base, different system requirements. Attempting to include facilities management would double the product scope with no operational overlap.	Evaluate a dedicated facilities management platform integration in Phase 3.
Mobile native application (iOS/Android)	Development cost and timeline are not justified for Phase 1. The primary users of approval workflows are office-based. Desktop browser access is sufficient for Phase 1 adoption.	Mobile-responsive web UI is Phase 2. Native app is not on the current roadmap unless mobile adoption data post-Phase 1 warrants it.
Multi-currency support	All J-Vo leases are USD-denominated. There is no current business requirement for multi-currency. Adding it introduces complexity with no present-day return.	Revisit if J-Vo's portfolio expansion strategy includes international properties.
HR, payroll, or employee management integration	No functional overlap with lease operations. Out of scope permanently for this product.	Not planned.

8. Executive Approval

Before Phase 1 development commences and investment is committed. Post-approval changes to scope, timeline, or investment level require a formal Change Request submitted to the Product Owner and reviewed by the CFO.

Name & Role	Division	Approval Scope	Date	Signature
Chief Financial Officer	Finance	Investment Authorization + Executive Sponsor		
Vice President, Property Operations	Property Operations	Product Owner + Scope Approval		
IT Director	Technology	Technical Architecture Approval		
Director of Finance Operations	Finance	Finance Requirements + OF Integration Scope		
Director of Legal & Compliance	Legal	Compliance & Audit Requirements		
Head of Internal Audit	Audit	Audit Trail & Compliance Standards		
Director of Product, Technology Division	Technology	Document Author		

This document is confidential and intended solely for internal use. Unauthorized distribution is prohibited.
